

# Module: NETCURL

The NETCURL module is a package with network handling routines and "smart" network communication libraries. By means, the module find available drivers on the platform it resides, and communicates with a "best practice". No pre-setup is required like many other libraries - netcurl always returns prepared data from the source that it is requesting data from.

[Version 6.0 can be found here.](#)

## NETCURLv6.1

NETCURL is about to change shape and behaviour a bit, but since it won't break backwards compatibility with 6.0, the next jump is 6.1 rather than 7.0.
