

TorneLIB Plugins: Pluggables

TorneLIB is able to handle plugins by the "pluggable" class and some libraries, primary such libraries we need to use ourselves, are linked in the main library. For example, a default template handler (Smarty) and JpGraph are currently supported by TorneLIB). To not mix up files and libraries, the pluggables are configurable through `tornevall_config.json` that is normally put into `/etc` (You might want to take a look on the example config file `tornevall_config.sample.json`).

Pluggable libraries path are set up in the **PluggableAutoPath** variable and the default is pointed to **`/usr/local/TorneLIB-Libraries`**. To install such supported library, for example JpGraph, download the library from <http://jgraph.net/download/> and then extract the archive and put it in this path. Just make sure that you are removing the current version number of JpGraph, as the pluggable will look for **`PluggableAutoPath/jgraph`**.
