

Actions and filters

This plugin offers a bunch of internal filters and actions. Below is a list of them.

Filter name	Type	In	Return	Description						
rbwc_admin_dynamic_content	filter	\$content	\$yourContent	Renders dynamic content for each section. If something specific, that is not included in the form fields, this could be used and will be appended in the bottom of each section.						
rbwc_get_dependent_settings	filter	\$currentArray	\$yourArray	If settings are dependent of other activated options in the configuration, this filter should be used. The plugin uses this internally to enable/disable the developer-options tab.						
rbwc_get_plugin_information	filter	\$content	\$yourContent	Content added to this section will be shown in the information/support, as a part of the "version view". If you for example need to show openssl releases or other vital data for your platform, you should add it here. Example: <pre>['OpenSSL version' => defined('OPENSSL_VERSION_TEXT') ? OPENSSL_VERSION_TEXT : '']</pre> <table border="1"> <tr> <td>Plugin-version</td> <td>0.0.1.0</td> </tr> <tr> <td>Composer-version</td> <td>0.0.1.0</td> </tr> <tr> <td>PHP-Version</td> <td>7.2.31-1+ubuntu18.04.1+deb.sury.org+1</td> </tr> </table>	Plugin-version	0.0.1.0	Composer-version	0.0.1.0	PHP-Version	7.2.31-1+ubuntu18.04.1+deb.sury.org+1
Plugin-version	0.0.1.0									
Composer-version	0.0.1.0									
PHP-Version	7.2.31-1+ubuntu18.04.1+deb.sury.org+1									
rbwc_can_display_order_info_after_details	filter	boolean	boolean	rbwc_can_display_order_info_after_<WHERE> The can_display-trio is used to disable each payment info section in the admin view. The details section also has a separate action triggers instead of the standard action from woocommerce. That action delivers all payment information required to recreate the "billing information" from v2.x						
rbwc_show_order_details	action	\$orderData	is echo	This action is executed right after the rbwc_can_display_order_info_after_details -filter. By disabling the three can_display_order_info filters, it is possible to create your own view right after the order details in the admin. If pushed in here, in case the future requires a different view from this plugin.						
rbwc_can_display_order_info_after_billing	filter	boolean	boolean	rbwc_can_display_order_info_after_<WHERE> The can_display-trio is used to disable each payment info section in the admin view.						
rbwc_can_display_order_info_after_shipping	filter	boolean	boolean	rbwc_can_display_order_info_after_<WHERE> The can_display-trio is used to disable each payment info section in the admin view.						
rbwc_get_payment_field_size	filter	\$size, \$fieldName	integer	If you believe you need a shorter or longer value for the default payment field length, that is set to 24, you can apply for that value						
rbwc_cancel_order	action	WC_Order	is action	This is not a filter that returns a true or false value - if developers or other plugins for example need to stop something before processing a payment for Resurs Bank, this is a place to push out an exception. Any exception thrown here will reflect back to the client and show that exception as a custom error message.						

rbwc_prefer_article_number_sku	filter	boolean	boolean	If you have further requirements of how article numbers are fetched, you could return true for this, to make the plugin use Sku inste exists.
rbwc_get_article_number	filter	\$currentArticleNumber, WC_Product	\$theArticleNumber	If you have further ways of fetching an article from a WC_Product object, this is where you do it.
rbwc_coupons_exempt_tax	filter	boolean, WC_Coupon	boolean	For special occasions when the options should remain untouched but we still need to make exceptions for coupons.
rbwc_get_coupon_vat_percent	filter	integer	integer	Default value for vat percent in the coupon calculation method is 0. Coupons are normally, at least in Sweden, already applied wi
