

# InfraGuard Project

Welcome to the InfraGuard project landing page.

The InfraGuard project is a system that monitors a list of services and sites by ping, http, etc. The TorneAPI i the central site that delegates server list to endpoint nodes on the internet, which then reports back to the central server. As the servers are reporting back to the central, we'll get to know which other sites that is not responding or which sites they have tried to contact that not responding. The more unresponsives, the more importance to report to the monitoring client.

The Statuspage is a part of the infraguard project: <https://status.tornevall.net/>
