

Services and API

This page holds information about Tornevall Networks current WebAPIs. The collection of API's are primarily reachable from the URL <https://api.tornevall.net> and are separated into which version it is. It is highly recommended that you always use the API through SSL (https), since some of our methods are only bound to secure communication (for example, all authentication methods is only available through secure channels).

Versioning

The application versioning indicates that if you have an older client, there is not guarantee for it to work with yours. Normally, it should however, since this is mostly about backwards compatibility and how the API returns responses.

Newer versions may look a bit different compared to the older, but since there is a defined standard of responses after 1.0.4/1.0.5 there should be minor problems with this part.

API usage list

- [API v2.0](#)
- [GSM Network](#)
